

Emotional Comfort Cabin

About This Project

<https://github.com/Logic-syd/Love-Story-Theater>

This is a full-stack, AI-powered web application I built to explore the intersection of technology and emotional support. It's a safe space for users who are feeling down about their relationship. Through a carefully guided, empathetic conversation, the app gathers details about their situation and their partner, then uses an AI to generate a unique, hopeful story that reframes their current problem as a temporary trial on the path to a happy future.

My goal was to create an experience that feels less like a tool and more like a warm, understanding friend.

You can try the live version here: <https://love-story-theater.vercel.app/>

Key Features

- **Dynamic & Empathetic Dialogue:** The heart of the app is a non-linear, multi-stage conversational flow. To keep the experience fresh, the app randomizes questions from different pools and uses an AI-driven interaction to generate contextual, follow-up questions. This makes every conversation feel natural and unique.
- **Advanced Prompt Engineering:** I authored and refined a series of complex prompts to precisely control the AI's "best friend" persona. The prompts guide the AI's narrative style, content structure, and emotional tone, transforming the user's raw input into a coherent and uplifting story.
- **Mobile-First & Internationalized:** The chat interface was built with a mobile-first approach using Material-UI for a clean, responsive experience on any device. The entire application is architected for internationalization, with all text content managed in a separate configuration file (currently supporting Chinese, English, and German).
- **Secure Full-Stack Architecture:** I implemented a decoupled, stateless architecture with a Next.js frontend and a Kotlin/Ktor backend. The backend acts as a secure proxy to the LLM API, ensuring all user data is isolated and API keys are protected.

Tech Stack

- **Frontend:** React, Next.js, TypeScript, Material-UI (MUI), Axios
- **Backend:** Kotlin, Ktor
- **AI Service:** DeepSeek API
- **Deployment:** Vercel (Frontend), Render (Backend), Docker

Getting Started

To get a local copy up and running, follow these simple steps.

Prerequisites

- Node.js (v18+)
- JDK (11+)
- Git

Installation

1. Clone the repository:

```
git clone https://github.com/Logic-syd/Love-Story-Theater.git
cd Love-Story-Theater
```

2. Set up the Backend:

```
cd love-story-backend

# Create a .env file and add your API key
echo "DEEPSEEK_API_KEY=sk-xxxxxxx" > .env

# Run the server
./gradlew run
```

Your backend will be running at <http://localhost:8080>.

3. Set up the Frontend (in a new terminal):

```
cd love-story-frontend
npm install
npm run dev
```

Open <http://localhost:3000> in your browser to see the app.
